

Patching When the Severity Level Is Unknown

Last Modified on 12/09/2020 10:54 pm EST

When a software patch listed in the Automox console shows a severity level of "Unknown", this generally means that Automox was unable to retrieve sufficient information to give it a rating. Additionally, some vendors announce a vulnerability, reserve a CVE, but then do not provide any information. To ensure CVEs with no severity score are automatically updated, you can use either a Patch All or an Advanced Policy. We recommend using a **Patch All** policy.
